

Clustering and Similarity: Retrieving Documents

Emily Fox & Carlos Guestrin

Machine Learning Specialization

University of Washington

Retrieving documents of interest

Document retrieval

- Currently reading article you like

Document retrieval

- Currently reading article you like
- **Goal:** Want to find similar article

Document retrieval

Challenges

- How do we measure similarity?
- How do we search over articles?

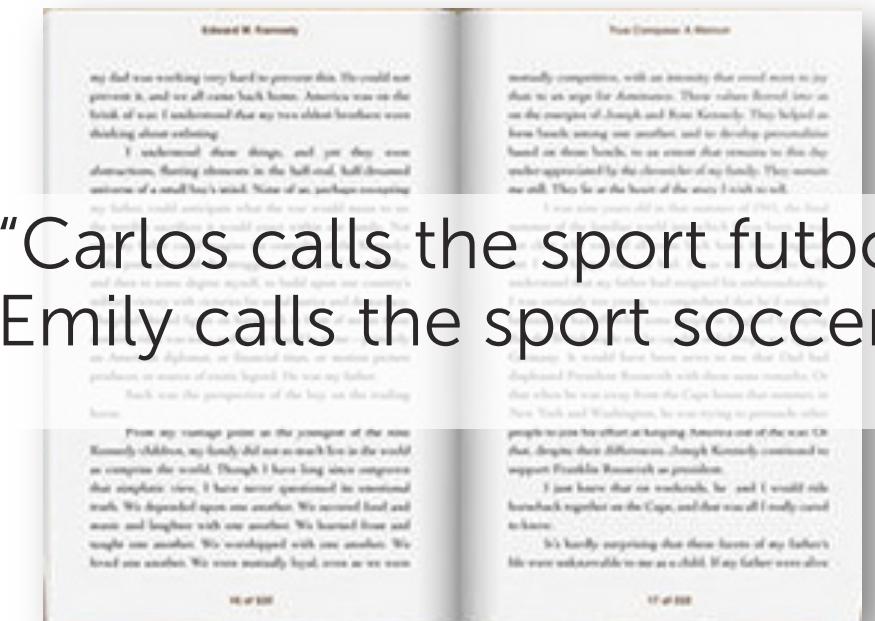

Word count representation for measuring similarity

Word count document representation

- Bag of words model
 - Ignore order of words
 - Count # of instances of each word in vocabulary

Carlos the tree calls sport cat futbol dog soccer Emily

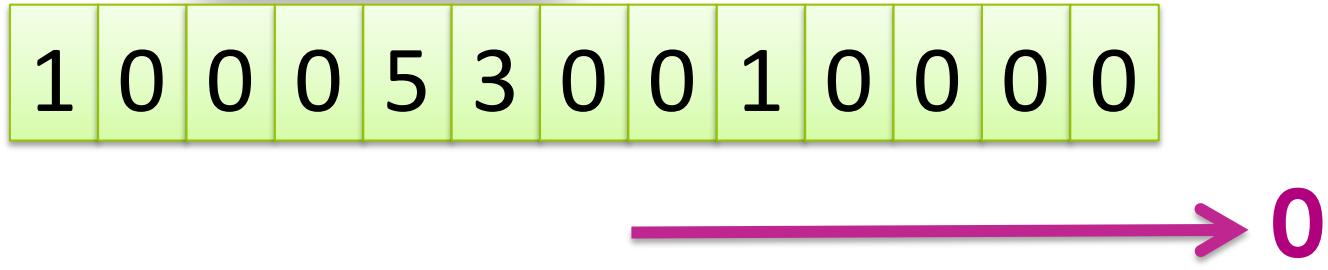

Measuring similarity

$$\begin{array}{r} 1^*3 \\ + \\ 5^*2 \\ \hline = 13 \end{array}$$

Measuring similarity

Issues with word counts – Doc length

Edward W. Kennedy

mg that we working very hard to prevent this. We could not prevent it, and we all come back home. America was on the side of us, and we all come back home. There were no other choices about collecting.

I wouldn't dare do this, and I am still doing services of a small boy's mind. None of us, perhaps excepting my wife, have ever been to England. But my father, the terrible scold, he would never take our family. Not even my father could imagine the control of the British in the world. Though I have long since forgotten the details, I do remember that my father did not like England, and that we never stayed in a hotel again once we crossed the Atlantic.

The plain-faced figure on boardwalk is front of us of an American diploma, or financial trust, or some previous problem in excess of what I can tell you.

Such was the perspective of the boy on the trading house.

From my vantage point as the younger of the two Kennedy children, my family did not much care for the world as compared to the world. Though I have long since forgotten the details, I do remember that my father did not like England, and that we never stayed in a hotel again once we crossed the Atlantic.

We depended upon one another. We received food and money and love from one another. We worked with one another. We lived one another. We were mutually loyal, even as we were

Solution = normalize

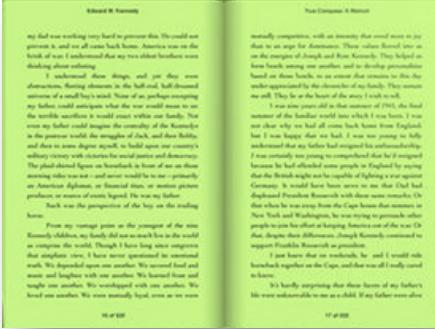

$$\sqrt{1^2 + 5^2 + 3^2 + 1^2}$$

Compute the norm of the word count vector.

Prioritizing important words with tf-idf

Issues with word counts – Rare words

Common words in doc: “the”, “player”, “field”, “goal”

Dominate rare words like: “futbol”, “Messi”

Document frequency

- What characterizes a **rare word**?
 - Appears **infrequently** in the corpus Up-weight rare words
- Emphasize words appearing in **few docs**
 - Equivalently, discount word **w** based on
of docs containing w in corpus

Important words

- Do we want only rare words to dominate???
- What characterizes an **important word**?
 - Appears frequently in document
(common locally)
 - Appears rarely in corpus (**rare globally**)
- Trade off between **local frequency** and
global rarity

TF-IDF document representation

- Term frequency – inverse document frequency (tf-idf)

TF-IDF document representation

- Term frequency – inverse document frequency (tf-idf)
- Term frequency

- Same as word counts

TF-IDF document representation

- Term frequency – inverse document frequency (tf-idf)
- Term frequency

- Inverse document frequency

$$\log \frac{\# \text{ docs}}{1 + \# \text{ docs using word}}$$

TF-IDF document representation

- Term frequency – inverse document frequency (tf-idf)
- Term frequency

- Inverse document frequency

$$\log \frac{\# \text{ docs}}{1 + \# \text{ docs using word}}$$

word in many docs rare word

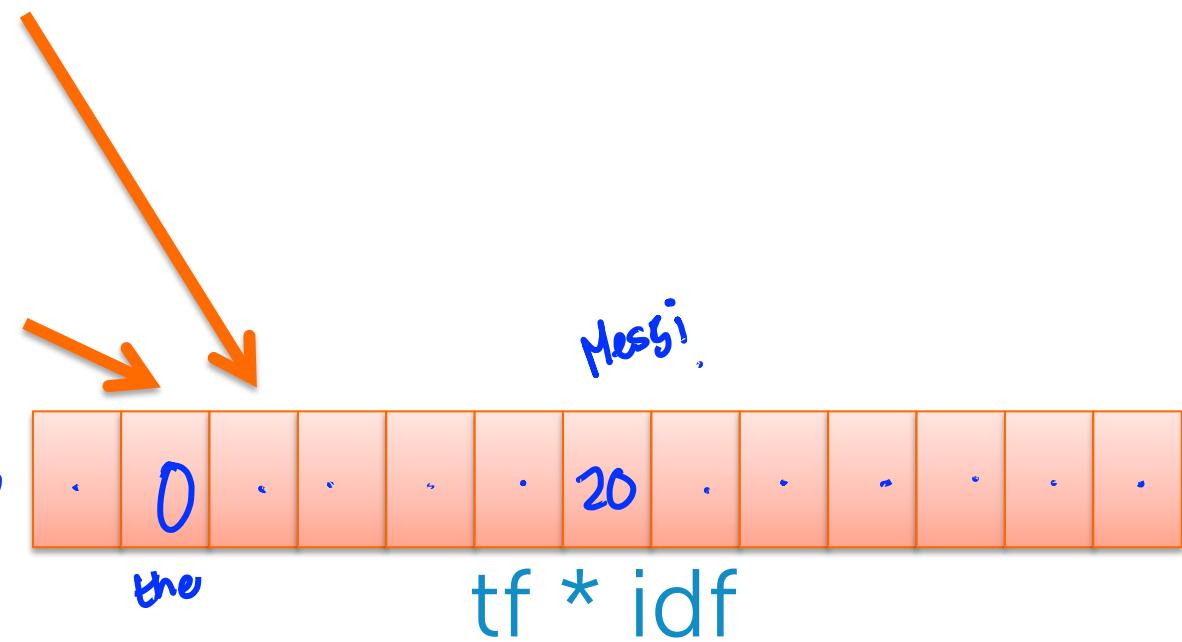

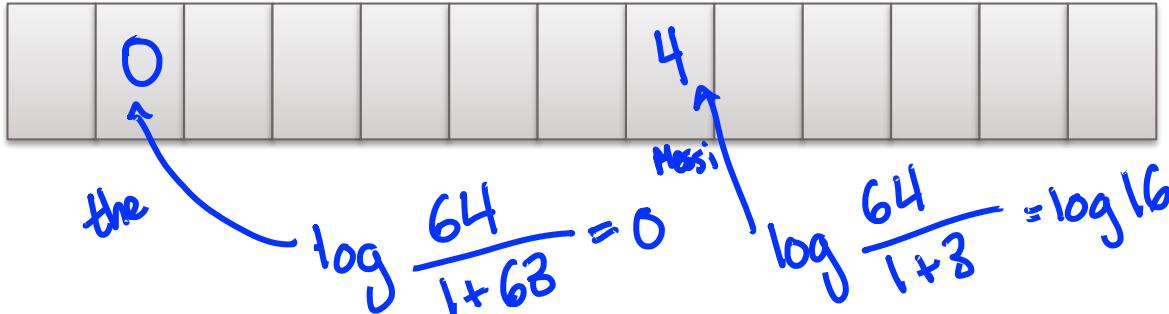

$$\log \frac{\text{large } \#}{1 + \text{large } \#} \approx \log 1 = 0$$
$$\log \frac{\text{large } \#}{1 + \text{small } \#} \rightarrow \text{large } \#$$

TF-IDF document representation

- Term frequency – inverse document frequency (tf-idf)
- Term frequency

- Inverse document frequency

Retrieving similar documents

Nearest neighbor search

- Query article:

- Corpus:

- **Specify:** Distance metric
- **Output:** Set of most similar articles

1 – Nearest neighbor

- **Input:** Query article 
- **Output:** *Most* similar article
- Algorithm:
 - Search over each article  in corpus
 - Compute $s = \text{similarity}(\text{query}, \text{article})$
 - If $s > \text{Best_s}$, record  = and set $\text{Best_s} = s$
 - Return 

k – Nearest neighbor

- **Input:** Query article
- **Output:** *List of k* similar articles

Instead of keeping just the most related article, keep a priority queue of the top k articles found so far.

Clustering documents

Structure documents by topic

- Discover groups (*clusters*) of related articles

SPORTS

WORLD NEWS

What if some of the labels are known?

- Training set of labeled docs

SPORTS

ENTERTAINMENT

SCIENCE

Multiclass classification problem

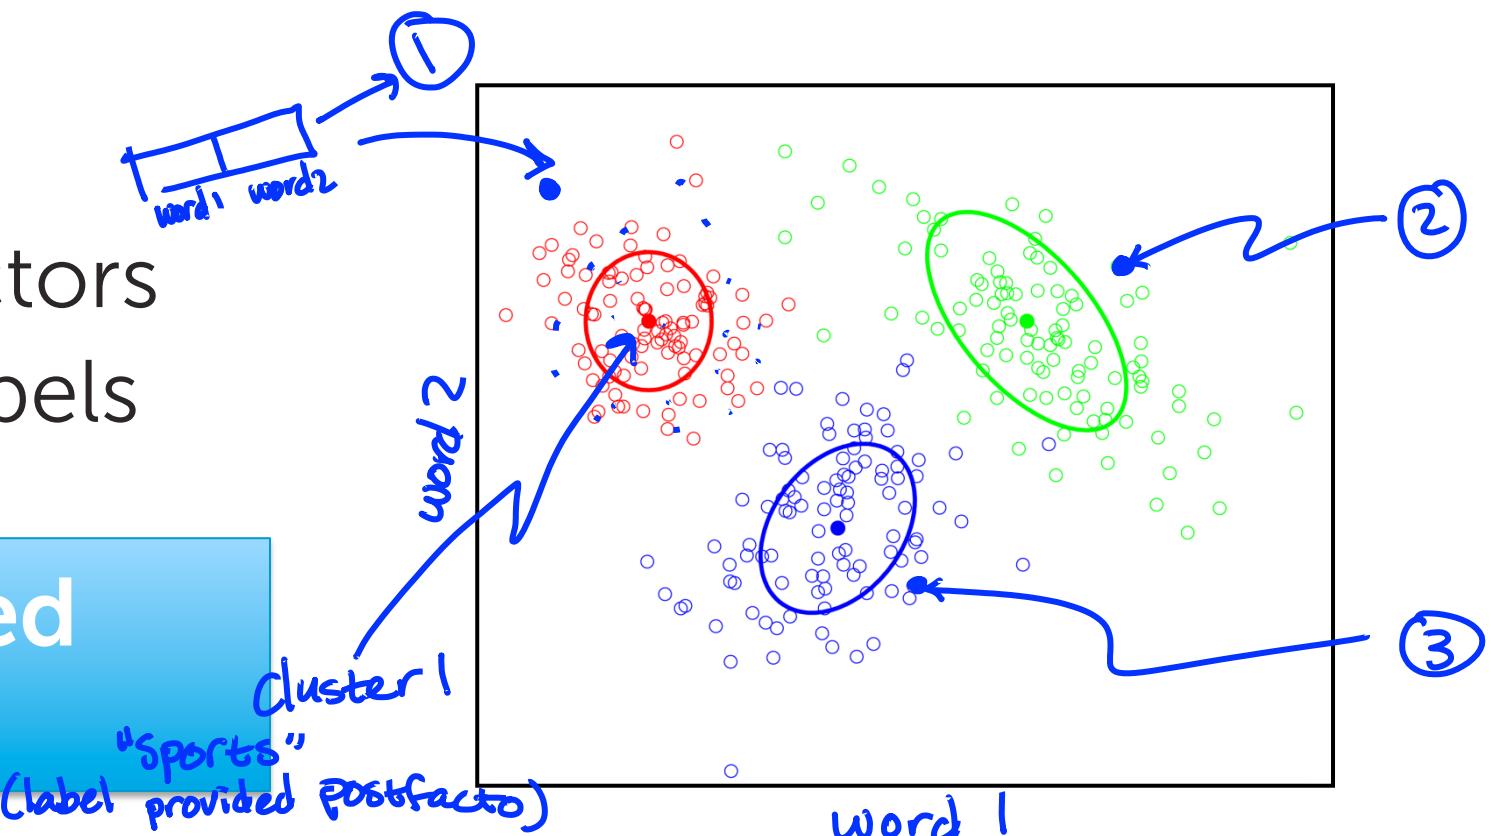

Example of
supervised learning

Clustering

- No labels provided
- Want to uncover cluster structure

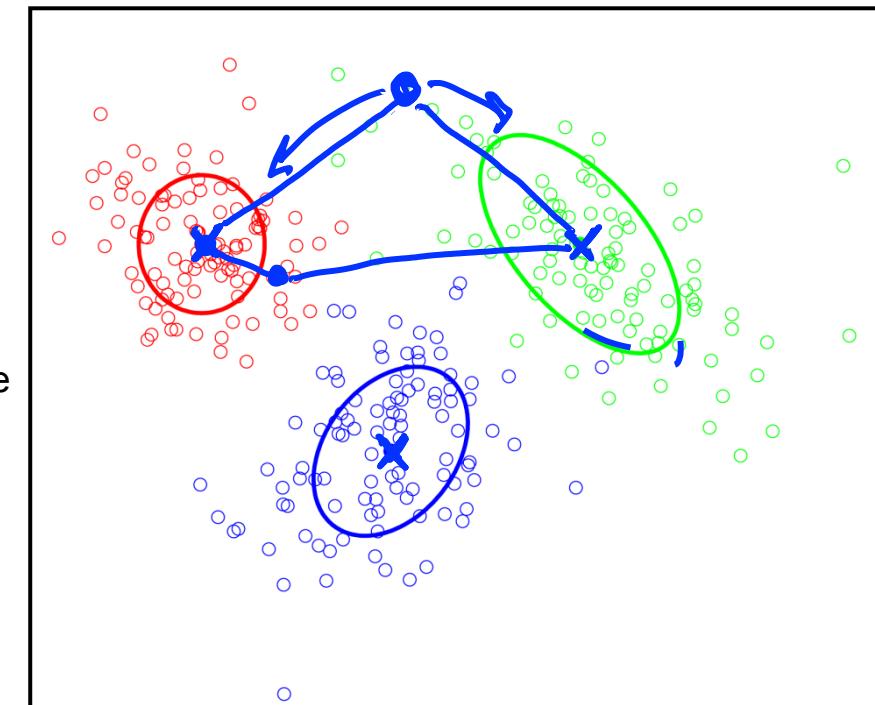

- **Input:** docs as vectors
- **Output:** cluster labels

An unsupervised learning task

What defines a cluster?

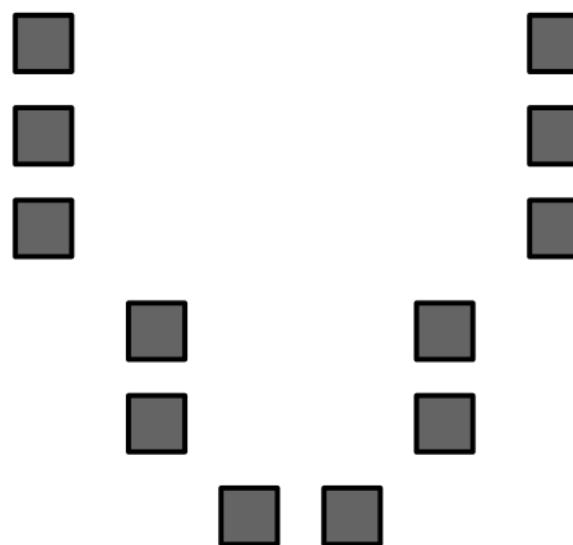

- Cluster defined by center & shape/spread
 - Assign observation (doc) to cluster (topic label)
 - Score under cluster is higher than others
 - Often, just more similar to assigned cluster center than other cluster centers
- score every observation based on cluster center/shape

k-means

a clustering algorithm

- Assume
 - Similarity metric =
distance to cluster center
(smaller better)

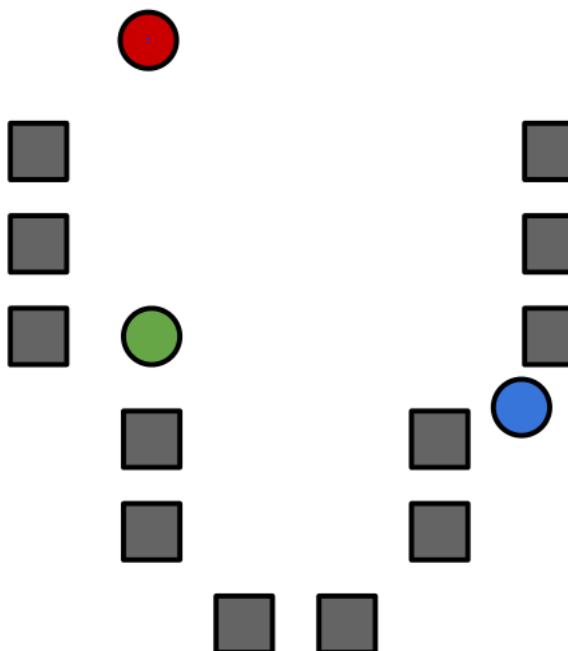

DATA
to
CLUSTER

k-means algorithm

0. Initialize cluster centers

- specify the number of clusters ahead of time
- k clusters, look at means of clusters, just the cluster centers, when assigning points to different clusters.
- many ways to initialize where to put cluster centers, in this example just randomly initialize 3 centers.

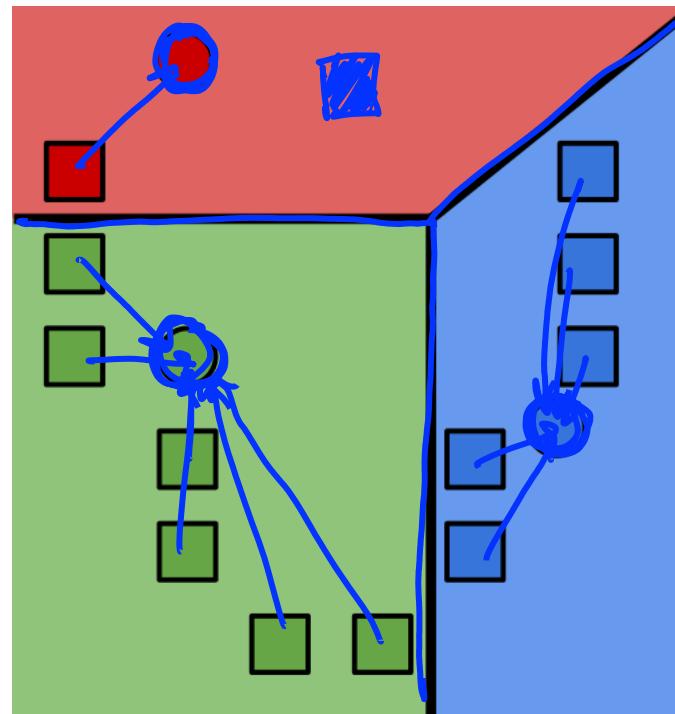

k-means algorithm

0. Initialize cluster centers
1. Assign observations to closest cluster center

A way to do this is something called Voronoi tessellation.

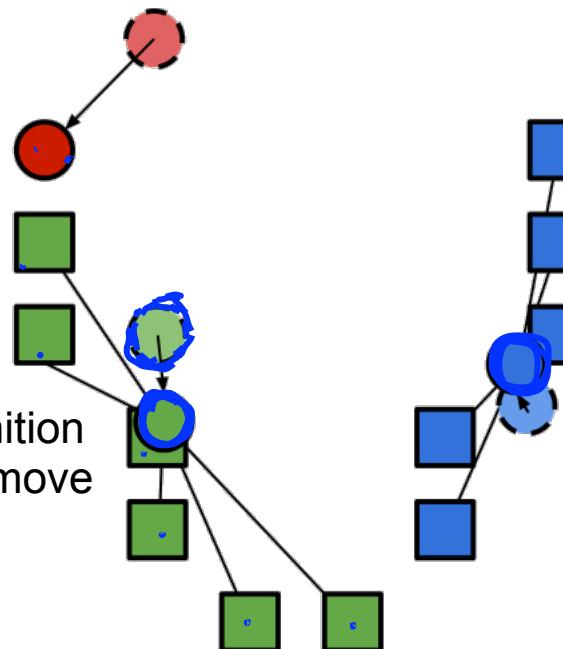

- define regions, which represent areas where any observation might get

k-means algorithm

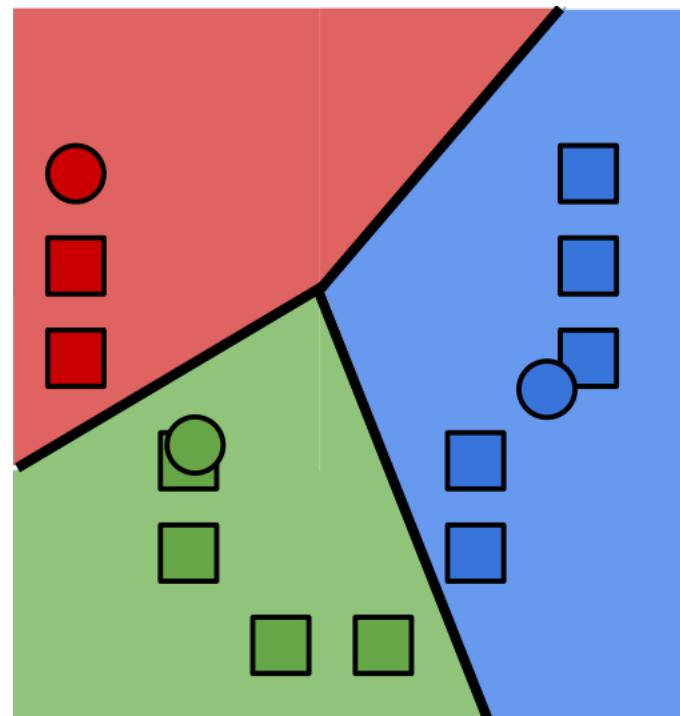

0. Initialize cluster centers
1. Assign observations to closest cluster center
2. Revise cluster centers as mean of assigned observations

cluster centers not really representing structure underlying data -> iterate this process, update definition of cluster center based on assigned observations (move to center of mass of all assigned observations).

k-means algorithm

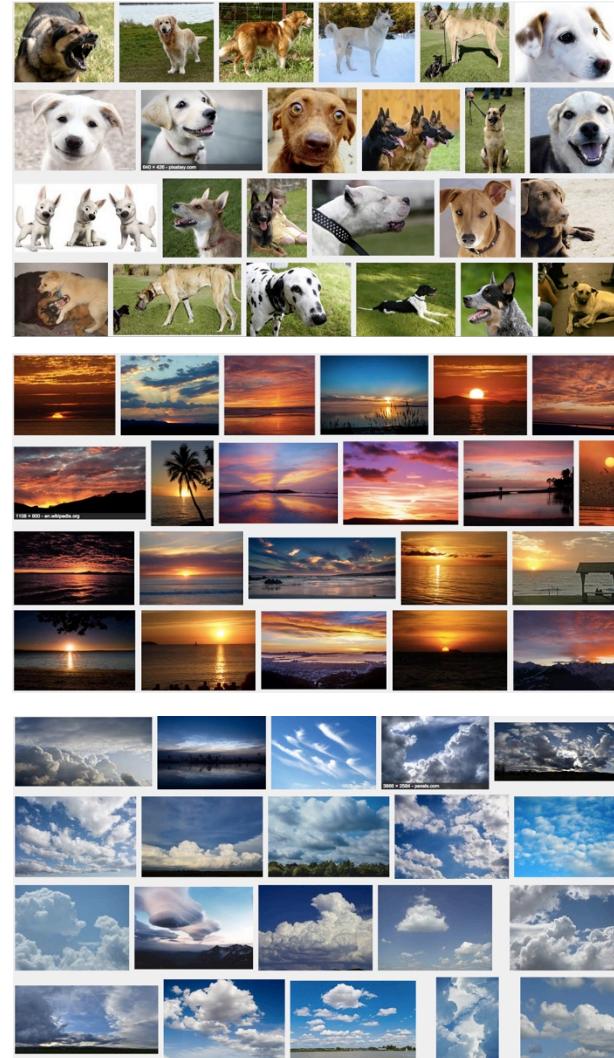

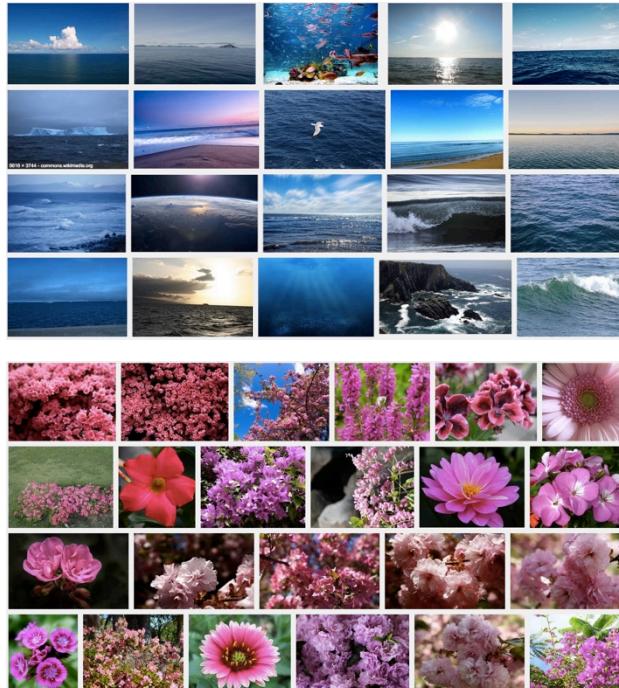

0. Initialize cluster centers
1. Assign observations to closest cluster center
2. Revise cluster centers as mean of assigned observations
3. Repeat 1.+2. until convergence

Other examples

Clustering images

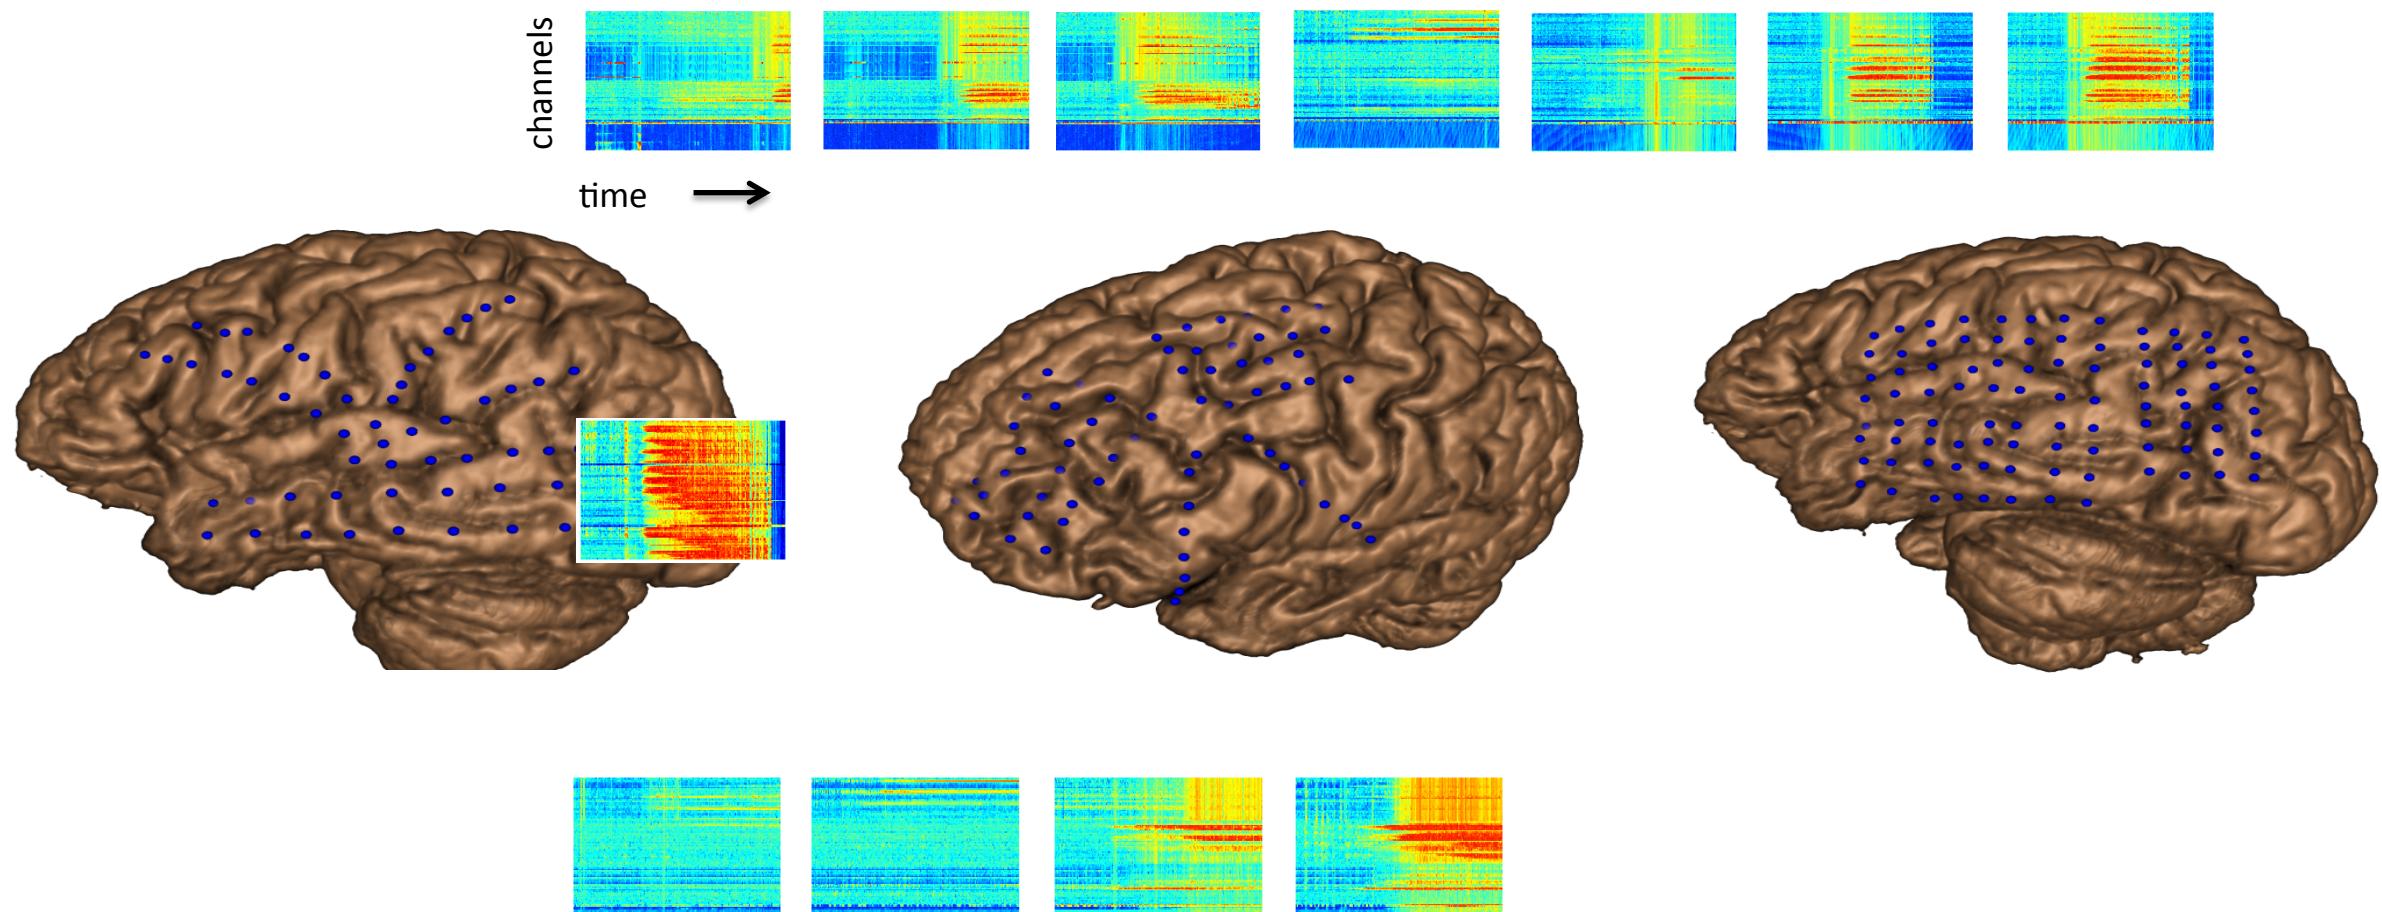

- For search, group as:
 - Ocean
 - Pink flower
 - Dog
 - Sunset
 - Clouds
 - ...

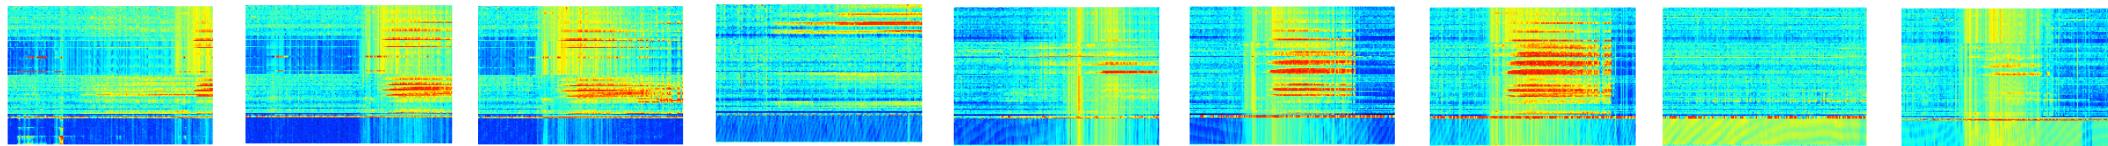

Grouping patients by medical condition

- Better characterize subpopulations and diseases

Example: Patients and seizures are diverse

Cluster seizures by observed time courses

Products on Amazon

- Discover product categories from purchase histories

~~"furniture"~~
"baby"

- Or discovering groups of **users**

Structuring web search results

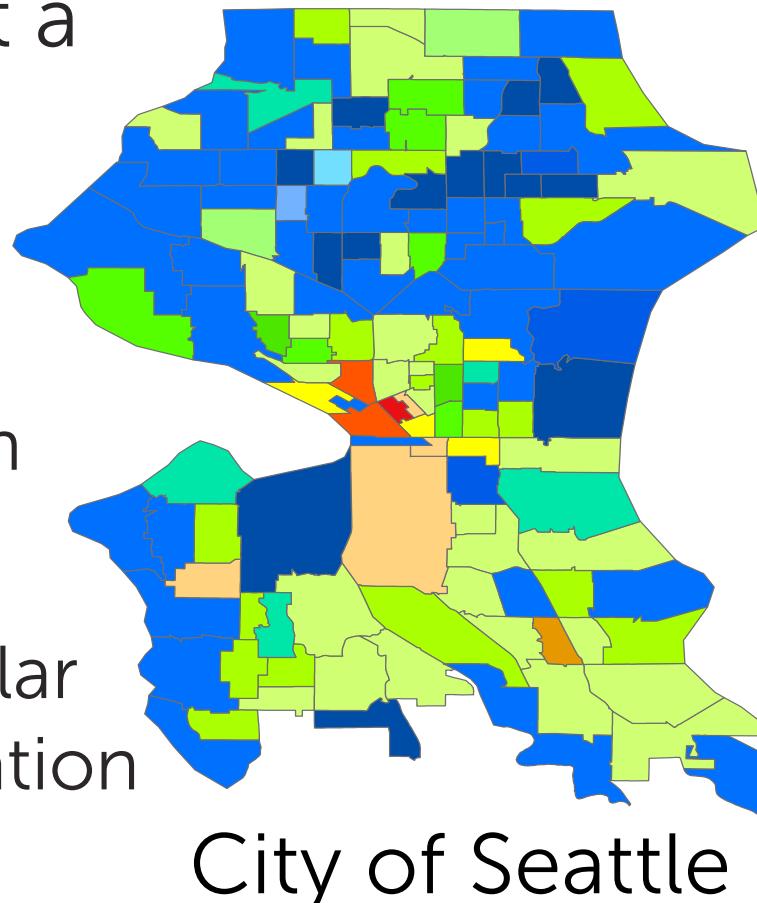

- Search terms can have multiple meanings
- Example: “**cardinal**”

- Use clustering to **structure output**

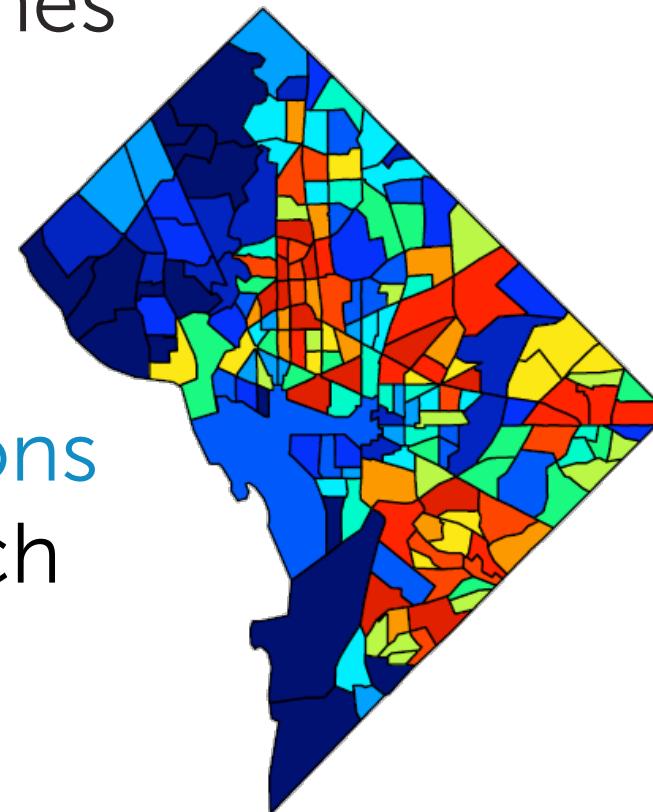

Discovering similar neighborhoods

- **Task 1:** Estimate price at a small regional level
- **Challenge:**
 - Only a few (or no!) sales in each region per month
- **Solution:**
 - Cluster regions with similar trends and share information within a cluster

Discovering similar neighborhoods

- **Task 2:** Forecast violent crimes to better task police
- Again, **cluster regions** and **share information!**
- Leads to **improved predictions** compared to examining each region independently

Washington, DC

Summary for clustering and similarity

What you can do now...

- Describe ways to represent a document (e.g., raw word counts, tf-idf,...)
- Measure the similarity between two documents
- Discuss issues related to using raw word counts
 - Normalize counts to adjust for document length
 - Emphasize important words using tf-idf
- Implement a nearest neighbor search for document retrieval
- Describe the input (unlabeled observations) and output (labels) of a clustering algorithm
- Determine whether a task is supervised or unsupervised
- Cluster documents using k-means (algorithmic details to come...)
- Describe other applications of clustering
